

Challenge Problem 1

K.A. Raja Babu

Download latex-tikz code from

<https://github.com/ka-raja-babu/Matrix-Theory/tree/main/ChallengeProblem1>

Now,

$$\mathbf{BD} = (\mathbf{BB}^{-1})\mathbf{AB} \quad (2.0.8)$$

$$\Rightarrow \mathbf{BD} = \mathbf{IAB} \quad (2.0.9)$$

$$\Rightarrow \mathbf{BD} = \mathbf{AB} \quad (2.0.10)$$

1 CHALLENGE QUESTION 1

Show that the matrix $(t\mathbf{I} - \mathbf{nn}^T)$ in the given document is a rank 1 matrix for a parabola.

So,

$$\rho(\mathbf{AB}) = \rho(\mathbf{BD}) \quad (2.0.11)$$

2 SOLUTION

Let

$$\mathbf{V} = (t\mathbf{I} - \mathbf{nn}^T) \quad (2.0.1)$$

For any conic $ax^2 + 2bxy + cy^2 + 2dx + 2ey + f = 0$,

$$\mathbf{V} = \begin{pmatrix} a & b \\ b & c \end{pmatrix} \quad (2.0.2)$$

So, \mathbf{V} is a symmetric matrix such that

$$\mathbf{V} = \mathbf{V}^T \quad (2.0.3)$$

Theorem 2.1 (Spectral Theorem for Symmetric Matrix). *Symmetric matrices are always orthogonally diagonalizable matrices.*

Using (2.0.3) and theorem 2.1, \mathbf{V} is a diagonalizable matrix such that

$$\mathbf{P}^{-1}\mathbf{VP} = \mathbf{D} \quad (\text{Eigenvalue Decomposition}) \quad (2.0.4)$$

$$\mathbf{D} = \begin{pmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{pmatrix} \quad (2.0.5)$$

Let rank of matrix be represented by ρ .

Lemma 2.1. *Let \mathbf{A} be a $m \times n$ diagonalizable matrix. Then,*

$$\rho(\mathbf{A}) = \rho(\mathbf{B}^{-1}\mathbf{AB}) = \rho(\mathbf{D}) \quad (2.0.6)$$

Proof. Here, \mathbf{A} and \mathbf{D} are similar matrices such that

$$\mathbf{D} = \mathbf{B}^{-1}\mathbf{AB} \quad (2.0.7)$$

Since \mathbf{B} is an invertible matrix and hence a full rank matrix.

So,

$$\rho(\mathbf{AB}) = \rho(\mathbf{A}) \quad (2.0.12)$$

$$\rho(\mathbf{BD}) = \rho(\mathbf{D}) \quad (2.0.13)$$

\therefore Using (2.0.11), (2.0.12) and (2.0.13),

$$\rho(\mathbf{A}) = \rho(\mathbf{D}) \quad (2.0.14)$$

□

Definition 1. *Rank of a diagonal matrix is equal to the number of its non-zero eigen values.*

Now, in case of parabola,

$$\lambda_1 = 0 \quad (2.0.15)$$

$$\lambda_2 \neq 0 \quad (2.0.16)$$

And, in case of ellipse, hyperbola and circle,

$$\lambda_1 \neq 0 \quad (2.0.17)$$

$$\lambda_2 \neq 0 \quad (2.0.18)$$

\therefore Using def.1, lemma 2.1 and values of λ_1 and λ_2

,

For a parabola,

$$\rho(\mathbf{V}) = \rho(\mathbf{D}) = 1 \quad (2.0.19)$$

For ellipse, hyperbola and circle,

$$\rho(\mathbf{V}) = \rho(\mathbf{D}) = 2 \quad (2.0.20)$$
